

FOOTNOTES WITH APPLEWRITER

On occasion, I receive calls from erstwhile authors who wish to incorporate footnote entries in their writings and haven't the foggiest about how this is accomplished. Not too much available in instruction in the AW manuals and not very clear when you do come across a valid explanation. Essentially, a footnote can be entered in the context of your writing by delimiting it with the following:

The beginning of a footnote starts with a left parenthesis (, which is followed immediately (without intervening space) by a left-angle bracket <]. The ending of a footnote starts with a right-angle bracket >, followed by a right parenthesis ). For purposes of demonstration, you can simulate the following as an example of how to proceed to do this:

"If you are interested in using graphics and assimilating icons from various other sources without having to create your own images, you might consider the practicality of "Graphics Manager" (1) LPLAB 1. Minimum 256K byte RAM RABRP, and the versatility it offers over and above similar graphics applications. It, for example, has the ability to access "Print Shop" (2) LPLAB 2. Broderbund Software, Inc., San Rafael, California RABRP, and expand on those icons available in that software."

The symbology is necessarily omitted, because were it used, the footnote portions would not appear in the above text but would be transferred automatically to the bottom of the page in their numbered sequence. Thus, you see the LPLAB/RABRP delimiters subbing for the regularly used symbols."
