

I've been using Selector /// on the Apple Unidisk for about three weeks, but not without a few calls down south for a little help. The folks down there were quite helpful and were able to get me up and running without too many new gray hairs.

Just for a point of reference, I've got the following equipment: 256 K Apple ///, IIe mouse, profile, and the unidisk (3.5") The software I'm using is Selector ///, Desktop Manager and Draw On Three.

Desktop Manager (DTM) has 3 menu options that come with the initial purchase, these options are: Notepad, calender and calculator. These options come in handy but I am waiting for the spelling checker for 3 EZ Pieces and the graphing module. I use the calendar more than the other two options and couldn't give a good evaluation of the other two.

Draw On Three is another product that was purchased, but I though that this product would do graphing, but it will only enhance graphs not produce them, at least not easilly. So I will have to say I have not used this program enough to give an evaluation. (Come to the July 31st meeting to get the latest, editor).

Selector /// has performed as advertised, this program does in fact allow you to switch between programs with just a few keystrokes. I've installed this program on both the profile and unidisk.

There are some drawbacks that should be mentioned. Some programs are not compatible with the DTM installed on the unidisk and running selector /// - for instance: Draw On Three, Lazarus ///, the menu editor that comes with Selector ///, Pascal v 1.2 and the emulation][doesn't printout for some reason. Of course this could be something I'm doing wrong. In order to get around the incompatability problem, I had to create three boot disks, one with the DTM driver, the second without the DTM driver (these two are used with the unidisk) and the last one with the DTM driver for the profile.
