

Q8. Is there a way to insert CONTROL 5 in a program, rather than input it manually from the keyboard.

A8. CONTROL 5, when entered from the numeric keypad, turns off the video display (hit it again and it turns back on). The advantageous spots to use it is during recalculations of large VisiCalc spreadsheets or long search and replace operations in a word processor. CONTROL 5 speeds up recalculations by about 30%. When a spreadsheet is done with the recalculation, the screen automatically turns back on. As to inserting it in a program, I do not know, but would like to hear from anyone who knows how.
