

Q7. I would like to know if and how to run ProDos on the Apple ///, ie Habamerge.

A7. ProDos is the new operating system for the Apple //e and //c. It is an improvement on DOS 3.3, that is essentially a subset of A/// SOS. It uses the same hierarchical directory system and disk format as SOS, so is somewhat compatible with SOS. ProDos will run on the A/// in A[] emulation mode, if one has 64K. The only way I have done this is the the Titan ///+[] card.

Programs like HabaMerge have both ProDos and SOS on their boot disk, but when booted in native mode the A/// only uses the SOS portion. The actual Pascal code is the same for the Habamerge program both the for the A// and A///.
