

QUESTIONS

I am currently trying to get KEYSTROKE running so that I can use my Micro Sci 143 as the Mass Storage Device. I have tried to rename the Micro Sci as .profile instead of .d3. Well this worked once. It put the whole two disks on the micro sci and left me with a little room for storage. One problem, this only works once and never again and that's not very useful. Can anyone out there help me out.
