

The table below is the expanded version of the one previously published. We have included the latest version number (that we have) as well as the copyright date (if available). The driver sizes are approximate (plus or minus about 1K). The amount of room that each driver takes up varies with each combination of SOS drivers that you load; however, you can use this as an approximate guide.

Any corrections or additions to this list would be appreciated. We would appreciate you sending any public domain drivers that you currently have or if you have a later version of one that is on this list. We plan to put together a driver disk to put in our library. You can tell the version number of a driver by reading the driver into System Utilities and Editing the driver. The version number is listed under configuration block number 5. Some of the drivers on this disk are not public domain, like the Unidisk driver (On Three) or the .RAM128 (DA Datasystems) and are still available for purchase from the authors.
